

GIANT-CELLULAR-TREE-RITE-IS

GIANT-CELL ARTERITIS

- GCA is an inflammatory disease that affects the temporal artery
- It can affect blood supply to the eye causing sudden blindness
- Diagnosis can be made using patient histories and physical symptoms
- Gold standard tests for GCA would be a biopsy of the temporal artery
- Biopsy is more *pyrite* however as it is possible to miss affected tissue, or histopathologists can disagree on classification
